

# Electromagnetic Probes in Heavy-Ion Collisions II

Hendrik van Hees

Goethe University Frankfurt and FIAS

March 31-April 04, 2014

- 1 Heavy-ion phenomenology
- 2 Theory of electromagnetic probes
  - The McLerran-Toimela formula
- 3 In-medium current-current correlator
  - Relation to chiral symmetry
  - QCD sum rules
- 4 Hadronic models for vector mesons
  - chiral symmetry constraints
  - Vector-meson dominance model (hadronic part)
  - Realistic hadronic models for light vector mesons
  - Hadronic many-body theory (HMBT)
- 5 References
- 6 Quiz

# Heavy-ion phenomenology

# Heavy-ion collisions

- collisions of relativistic (heavy) nuclei
- many collisions of **partons** inside nucleons
- creation of many particles  $\Rightarrow$  **hot and dense fireball**
- formation of (thermalized) QGP?
- how to learn about properties of QGP?

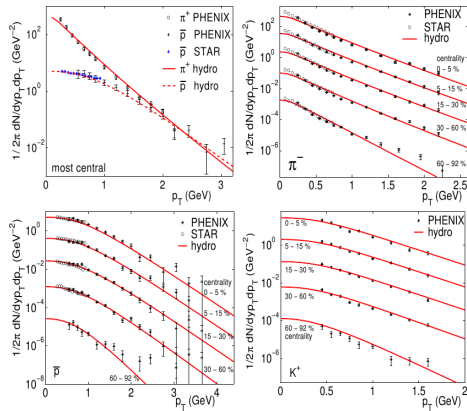

# Phase diagram of strongly interacting matter

- hot and dense matter: **quarks and gluons at high temperature**
- high-energy collisions of quarks and gluons  $\Rightarrow$  “**Deconfinement**”
- **quarks** and **gluons** relevant degrees of freedom  $\Rightarrow$  **Quark-Gluon Plasma**
- interactions still strong: **fast thermalization!**

# Hydrodynamical radial flow of the bulk

- ideal fluid in **local thermal equilibrium**
- **hydrodynamical model** for ultra-relativistic heavy-ion collisions
  - after short formation time ( $t_0 \lesssim 1 \text{ fm}/c$ )
  - **QGP** in **local thermal equilibrium**  $\rightarrow$  **hadronization** at  $T_c \simeq 160 - 190 \text{ MeV}$
  - chemical freeze-out: (**inelastic collisions cease**)  $T_{ch} \simeq 160 - 175 \text{ MeV}$
  - thermal freeze-out: (**also elastic scatterings cease**)

# Hydrodynamical behavior

- low- $p_T$  particle spectra compatible with **ideal-fluid** (hydrodynamics)  $\Rightarrow$  small shear-viscosity over entropy-density ratio,  $\eta/s \simeq 1/(4\pi)$
- medium in **local thermal equilibrium** (after short formation time  $\lesssim 1 \text{ fm}/c$ )

# Hydrodynamical behavior

- successful description with relativistic ideal and viscous hydrodynamics

[SJG11]

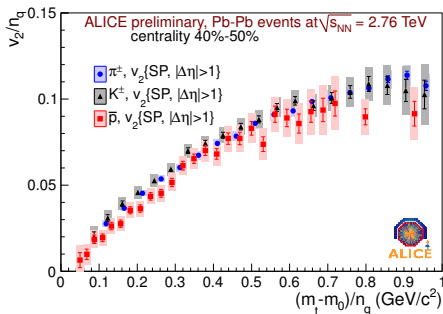

# Constituent-quark-number scaling of $v_2$

- Elliptic flow scales with number of **constituent quarks**

$$v_2^{(\text{had})}(p_T^{(\text{had})}) = n_q v_2^{(q)}(p_T^{(\text{had})}/n_q)$$

- recombination **Quarks** in the medium at  $T_c$
- meson and baryon  $v_2 = \simeq$  **sum of quark  $v_2$ 's**

[Krz11]

# Jet quenching

- jets going through medium **suppressed**
- not seen in d+Au collisions  $\Rightarrow$  **medium effect!**
- suppression: **medium of high density**  $\Rightarrow \rho > \rho_{\text{krit}}$

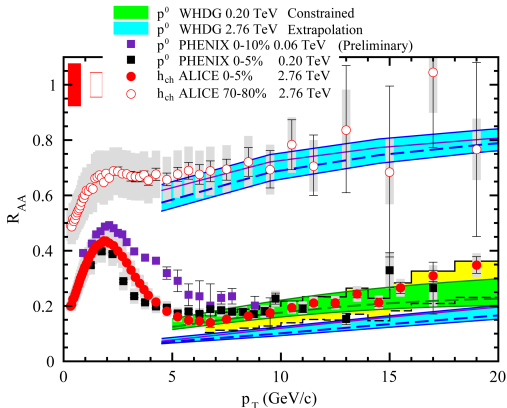

# Jet quenching

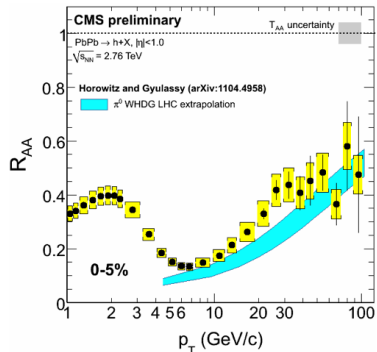

- comparison to **pp collisions**:  $R_{AA} = \frac{dN_{AA}/dp_t}{N_{\text{coll}}dN_{\text{pp}}/dp_t}$
- $R_{AA} < 1$  for large  $p_t$ : jets absorbed by medium
- photons ( $\gamma$ ) nearly unsuppressed: **medium transparent for photons**
- $\gamma$  only electromagnetically interacting!

# Jet quenching

- comparison to **pp collisions**:  $R_{AA} = \frac{dN_{AA}/dp_t}{N_{\text{coll}}dN_{pp}/dp_t}$
- $R_{AA} < 1$  for large  $p_t$ : jets absorbed by medium

[HG08]

- energy loss: **elastic scattering and radiation of gluons in QGP**
- density of medium  $> \rho_{\text{crit}}$ !

# QGP in HICs: “most sloshy liquid”?

- viscosity over entropy ratio:  $\eta/s$
- measure for “perfectness” of a fluid
- from Heisenberg uncertainty relation (or AdS/CFT):  $\eta/s \geq 1/(4\pi)$

# Theory of electromagnetic probes

# The McLerran-Toimela formula

- derivation of dilepton-production rate [MT85, GK91]

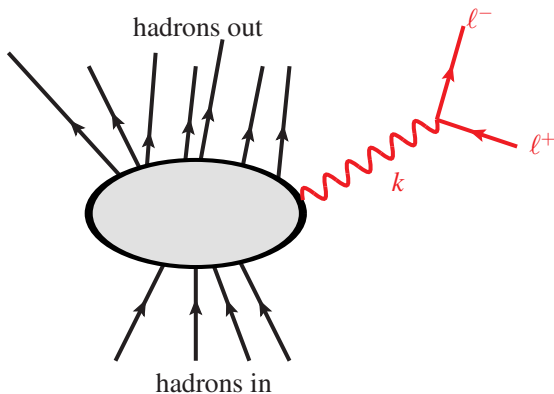

$$\frac{dR_{\ell+\ell^-}}{d^4k} = \frac{dN_{\ell+\ell^-}}{d^4x d^4k}$$

- radiation of **dileptons** from **thermalized strongly interacting particles** with total pair four-momentum  $k$
- dileptons** escape fireball without any final-state interactions
- calculation exact concerning **strong interactions**
- leading-order  $\mathcal{O}(\alpha^2)$  in **QED**
- implies assumption that leptons don't suffer final-state interactions

$$H_{\text{em}}^{(\text{int})} = e \int d^3\vec{x} J_\mu(t, \vec{x}) A^\mu(t, \vec{x}), \quad A^\mu(t, \vec{x}) = \frac{\varepsilon^\mu}{2\omega V} \exp(ik \cdot x)$$

- $J_\mu$ : exact (wrt. strong interaction!) em. current operator of quarks or hadrons in the Heisenberg picture wrt. strong interactions
- $e = \sqrt{4\pi\alpha}$ ,  $\alpha \simeq 1/137$

# The McLerran-Toimela formula

- Fermi's golden rule  $\Rightarrow$  transition-matrix element for process  $|i\rangle \rightarrow |f'\rangle = |f\rangle + |e^+e^-(k)\rangle$
- QED Feynman rules

$$S_{f'i} = \left\langle f \left| \int d^4x J_\mu(x) \right| i \right\rangle D_\gamma^{\mu\nu}(x, x') e\bar{u}_\ell(x') \gamma_\nu v_\ell(x')$$

# The McLerran-Toimela formula

- Fourier transformation: energy-momentum conservation  $|f'\rangle = |f, \ell^+ \ell^-(k)\rangle$

$$S_{fi} = T_{fi}(2\pi)^4 \delta^{(4)}(P_f + k - P_i)$$

- Fermi's trick: Rate

$$R_{f'i} = \frac{|S_{f'i}|^2}{\tau V} = (2\pi)^4 \delta^{(4)}(P_f + k - P_i) |T_{f'i}|^2$$

- summing over  $|f'\rangle$  and polarizations of **dilepton states**
- averaging over initial hadron states: heat bath (grand canonical)

$$\rho = \frac{1}{Z} \exp[-\beta(H_{\text{QCD}} - \mu_B Q_{\text{baryon}})]$$

# The McLerran-Toimela formula

- result (derivation see [GK91], Appendices)

$$\frac{dR_{\ell+\ell-}}{d^4k} = -\frac{\alpha^2}{3\pi^3} \frac{k^2 + 2m_\ell^2}{(k^2)^2} \sqrt{1 - \frac{4m_\ell^2}{k^2}} g_{\mu\nu} n_B(k^0) \text{Im} \Pi_{\text{ret}}^{\mu\nu}(k)$$

- **em. current-current correlator**

$$i\Pi_{\text{ret}}^{\mu\nu}(k) := \int d^4x \exp(ik \cdot x) \langle [J^\mu(x), J^\nu(0)] \rangle_{T, \mu_B} \Theta(x^0)$$

- written in (local) **restframe of the medium**
- in principle measurable: in **linear response approximation** Green's function for lepton current running through medium
- $k^2 = M^2 > 0$  **invariant mass of dilepton**
- probing medium with photons: **same correlator** for  $k^2 = M^2 = 0$
- then correlator  $\Leftrightarrow$  dielectric function  $\varepsilon(\omega)$  in electrodynamics!

# The McLerran-Toimela formula

- for **real photons**

$$\omega \frac{dR}{d^3\vec{k}} = -\frac{\alpha g_{\mu\nu}}{2\pi^2} \text{Im} \Pi_{\text{ret}}^{\mu\nu}(k) n_B(k^0), \quad k^0 \omega = |\vec{k}|$$

- written in (local) **restframe of the medium**
- Phenomenological **effective hadronic model**: **vector-meson dominance model**
- em. current  $\propto V^\mu$  (with  $V \in \{\rho, \omega, \phi\}$ )

$$\Sigma_{\mu\nu}^\gamma = \text{diagram with } G_\rho$$

The diagram illustrates the Vector Meson Dominance (VMD) model. It shows the electromagnetic current  $\Sigma_{\mu\nu}^\gamma$  as a sum of terms involving the interaction of a photon with a vector meson. The diagram consists of a red wavy line representing a photon, a blue wavy line representing a vector meson, and two yellow circles representing vertices. The label  $G_\rho$  is placed above the diagram, indicating the coupling constant for the  $\rho$  meson.

- Dilepton/photon rates:  $\propto A_V = -2 \text{Im} D_V^{(\text{ret})}$   
(**vector-meson spectral function!**)
- measuring **in-medium vector-meson** spectral function!?!)

# Em. current-current correlator

# Vector Mesons and electromagnetic Probes

- **photon** and **dilepton** thermal emission rates given by **same electromagnetic-current-correlation function** ( $J_\mu = \sum_f Q_f \bar{\Psi}_f \gamma_\mu \Psi_f$ )

- **McLerran-Toimela formula**

$$\Pi_{\mu\nu}^{\leq}(q) = \int d^4x \exp(iq \cdot x) \langle J_\mu(0) J_\nu(x) \rangle_T = -2n_B(q_0) \text{Im} \Pi_{\mu\nu}^{(\text{ret})}(q)$$

$$q_0 \frac{dN_\gamma}{d^4x d^3\vec{q}} = -\frac{\alpha_{\text{em}}}{2\pi^2} g^{\mu\nu} \text{Im} \Pi_{\mu\nu}^{(\text{ret})}(q, u) \Big|_{q_0=|\vec{q}|} f_B(p \cdot u)$$

$$\frac{dN_{e^+e^-}}{d^4x d^4k} = -g^{\mu\nu} \frac{\alpha^2}{3q^2 \pi^3} \text{Im} \Pi_{\mu\nu}^{(\text{ret})}(q, u) \Big|_{q^2=M_{e^+e^-}^2} f_B(p \cdot u)$$

- manifestly Lorentz covariant (**dependent on four-velocity of fluid cell,  $u$** )
- to lowest order in  $\alpha$ :  $4\pi\alpha\Pi_{\mu\nu} \simeq \Sigma_{\mu\nu}^{(\gamma)}$
- derivable from underlying thermodynamic potential,  $\Omega$ !

# Vector Mesons and chiral symmetry

- **vector** and **axial-vector** mesons  $\leftrightarrow$  respective current correlators

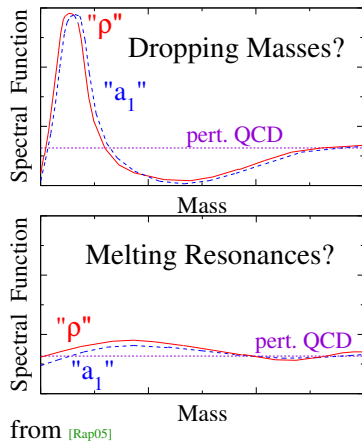

$$\Pi_{V/A}^{\mu\nu}(p) := \int d^4x \exp(ipx) \left\langle J_{V/A}^\nu(0) J_{V/A}^\mu(x) \right\rangle_{\text{ret}}$$

- Ward-Takahashi Identities of  $\chi$  **symmetry**  $\Rightarrow$  **Weinberg-sum rules**

$$f_\pi^2 = - \int_0^\infty \frac{dp_0^2}{\pi p_0^2} [\text{Im} \Pi_V(p_0, 0) - \text{Im} \Pi_A(p_0, 0)]$$

- spectral functions of vector (e.g.  $\rho$ ) and axial vector (e.g.  $a_1$ ) directly related to **order parameter of chiral symmetry!**

# Vector Mesons and chiral symmetry

- at high enough **temperatures and or densities**: melting of  $\langle \bar{q}q \rangle$
- $\Rightarrow$  spontaneous breaking of **chiral symmetry** suspended
- $\Rightarrow$  **chiral phase transition**; chiral-symmetry restoration ( $\chi$ SR)
- which scenario is right? microscopic mechanisms behind  $\chi$ SR?

- based on [LPM98]
- calculate current correlator, e.g., the vector part of the **em. current**

$$j_\mu = \frac{1}{2}(\bar{u}\gamma_\mu u - \bar{d}\gamma_\mu d)$$

- corresponds to the  **$\rho$**  meson!
- use **pQCD** to determine correlator

$$\Pi_{\mu\nu}(k) = \left( g_{\mu\nu} - \frac{k_\mu k_\nu}{k^2} \right) \Pi(k^2)$$

in deep spacelike region,  $Q^2 = -k^2 \gg \Lambda_{\text{QCD}}$

- related to **time-like** region  $\Rightarrow$  **sum rule**

$$\Pi(k^2) = \Pi(0) + cQ^2 + \frac{Q^4}{\pi} \int_0^\infty ds \frac{\text{Im}\Pi(s)}{s^2(s+Q^2-i\epsilon)}$$

- dispersion relation: **spectral function**  $\text{Im}\Pi!$

- left-hand side of **sum rule**
- pQCD + chiral models for baryon-pion interactions [sec. e.g., [DGH92]]

$$R(Q^2) := \frac{\Pi(k^2 = -Q^2)}{Q^2} = -\frac{1}{8\pi^2} \left(1 + \frac{\alpha_s}{\pi}\right) \ln\left(\frac{Q^2}{\mu^2}\right) + \frac{1}{Q^4} m_q \langle \bar{q}q \rangle + \frac{1}{24Q^4} \left\langle \frac{\alpha_s}{\pi} F_{\mu\nu}^a F^{a\mu\nu} \right\rangle - \frac{112}{81Q^6} \kappa \langle \bar{q}q \rangle^2$$

- additional cold-nuclear matter contributions

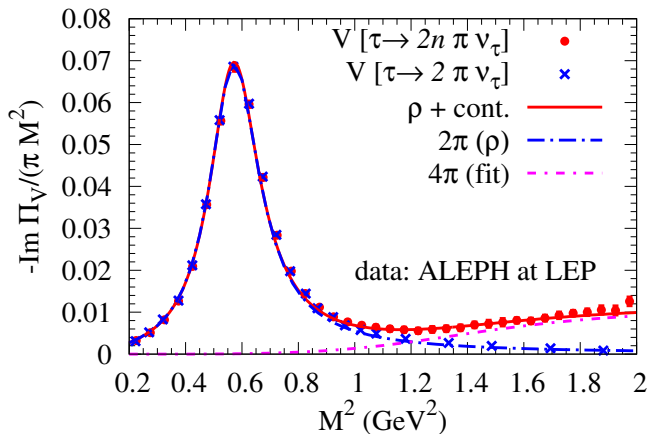

$$\Delta R(Q^2) = \frac{m_N}{4Q^4} A_2 \rho_N - \frac{5m_N^3}{12Q^6} A_4 \rho_N$$

- $A_{2,4}$  from parton-distribution functions
- also condensates medium-modified (in low-density approximation)

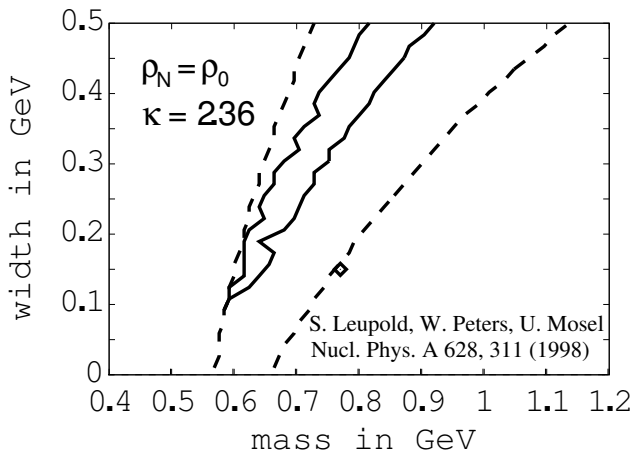

$$\langle \bar{q}q \rangle = \langle \bar{q}q \rangle_{\text{vac}} + \frac{\sigma_N}{2m_q} \rho_N,$$

$$\left\langle \frac{\alpha_s}{\pi} F_{\mu\nu}^a F^{a\mu\nu} \right\rangle = \left\langle \frac{\alpha_s}{\pi} F_{\mu\nu}^a F^{a\mu\nu} \right\rangle_{\text{vac}} - \frac{8}{9} m_N^{(0)} \rho_N$$

- right-hand side of **sum rule**
- use hadronic models to fit measured **vector-current correlator**
- e.g., ALEPH/OPAL data of  $\tau \rightarrow \nu + 2n\pi$

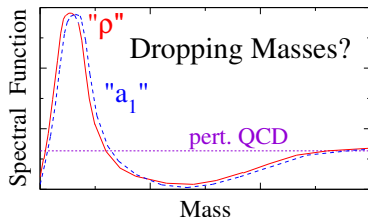

- typical result from [LPM98]

- possible medium effects on  $\rho$  meson
  - dropping mass, unchanged/small width
  - unchanged mass, broadened spectrum (large width)

# Scenarios for chiral symmetry restoration

- hadron spectrum must become **degenerate** between chiral partners

- models alone of little help (realization of  $\chi S$  not unique!)
  - “vector manifestation”  $\rho_{\text{long}} = \chi$  partner of  $\pi \Rightarrow$  dropping mass
  - “standard realization”  $\rho = \chi$  partner of  $a_1$ , extreme broadening + little mass shifts
- theory “shopping list”
  - effective hadronic models (well constrained in vacuum!)
  - and concise evaluation in the medium!**
  - models for **fireball evolution** (blast-wave parametrizations, hydro, transport, and transport-hydro hybrids)
  - must include partonic  $\rightarrow$  phase transition  $\rightarrow$  hadronic evolution
- precise  $\ell^+ \ell^-$  ( $\gamma$ ) data from HICs mandatory!**

# Hadronic models

# Effective hadronic models: chiral-symmetry constraints

- different realizations of **chiral symmetry**
- equivalent only on shell (“**low-energy theorems**”)
- model-independent conclusions only in **low-temperature/density limit** (chiral perturbation theory) or from **lattice-QCD calculations**
- QCD sum rules: allow dropping-mass or melting-resonance scenario
- use **phenomenological hadronic many-body theory** (HMBT) to assess medium modifications of vector mesons
  - build models with **hadrons** as effective degrees of freedom
  - based on **(chiral) symmetries**
  - constrained by data on cross sections, branching ratios,... in the vacuum
  - in-medium properties assessed by **many-body (thermal) field theory**

# Example: vector meson dominance model

- early model for **electromagnetic interaction** of charged pions [Sak60, KLZ67, GS68, Her92, Hee00]
- QED like U(1)-gauge model with massive vector meson for  $\rho_0$  and  $\pi^\pm$
- Stückelberg: introduce auxiliary scalar field for free vector mesons:

$$\mathcal{L}_\rho = -\frac{1}{4}V_{\mu\nu}V^{\mu\nu} + \frac{1}{2}m^2V_\mu V^\mu + \frac{1}{2}(\partial_\mu\varphi)(\partial^\mu\varphi) + m\varphi\partial_\mu V^\mu$$

- gauge invariant under local transformation

$$\delta V_\mu(x) = \partial_\mu\chi(x), \quad \delta\varphi = m\chi(x)$$

- Coupling to pions: **obey gauge invariance!** (like scalar QED)

$$\mathcal{L}_\pi = (D_\mu\pi)^*(D^\mu\pi) - m_\pi^2|\pi|^2 - \frac{\lambda}{8}|\pi|^4$$

- $D_\mu = \partial_\mu + igV_\mu$ ;  $g$ :  $\rho\pi\pi$  coupling

# VMD model (photon part)

- add photons:  $D_\mu = \partial_\mu + igV_\mu + ieA_\mu$
- Lagrangian for photons: usual (gauge fixed) QED
- additional direct  $\rho\gamma$  mixing [KLZ67]

$$\mathcal{L}_{\rho\gamma} = -\frac{e}{2g_{\rho\gamma}} V_{\mu\nu} A^{\mu\nu}$$

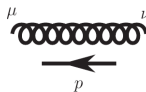

- classical field equations:  $\Rightarrow$  **electromagnetic current**

$$j_{\text{em}}^\nu = \partial_\mu A^{\mu\nu} = ie \left( 1 - \frac{g}{g_{\rho\gamma}} \right) \pi \overleftrightarrow{D}^\nu \pi^* + \frac{e}{g_{\rho\gamma}} m^2 V^\mu + \frac{e^2}{g_{\rho\gamma}^2} \partial_\mu A^{\mu\nu}$$

- for  $g_{\rho\gamma} = g$ :  $j_{\text{em}}^\nu = \frac{e}{g} m^2 V^\nu + \mathcal{O}(e^2)$ :  $\Rightarrow$  **“vector-meson dominance”**

# VMD model (Feynman rules in Feynman gauge)

$$= -i \frac{\eta^{\mu\nu}}{p^2 - M^2 + i0^+}$$

$$= -i \frac{\eta^{\mu\nu}}{k^2 + i0^+},$$

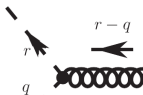

$$= \frac{i}{p^2 - m_\pi^2 + i0^+},$$

$$= i \frac{\not{p} + m_e}{p^2 - m_e^2 + i0^+},$$

- $\eta^{\mu\nu} = \text{diag}(1, -1, -1, -1)$
- $\Theta^{\mu\nu}(p) = \eta^{\mu\nu} - p^\mu p^\nu / p \cdot p$

$$= -ig(q^\mu + r^\mu),$$

$$= ig^2,$$

$$= -i \frac{\lambda}{8}$$

$$= -ie(q^\mu + r^\mu),$$

$$= ie\gamma^\mu,$$

$$= ie^2 \eta^{\mu\nu},$$

$$= 2ie g \eta^{\mu\nu},$$

$$= -i \frac{e}{g'} p^2 \Theta^{\mu\nu}(p).$$

# VMD model ( $\rho$ -self-energy and dressed $\gamma\pi\pi$ vertex)

- calculate  $\rho$ -self-energy (transversality from gauge invariance)

$$i\Pi_{\rho\pi\pi}^{\mu\nu}(p) = \text{Diagram 1} = is\Pi_{\rho\pi\pi}(s)\Theta^{\mu\nu}(p), \quad s = p^2$$

$$i\Pi_{\rho ee}^{\mu\nu}(p) = \text{Diagram 2} = is\Pi_{\rho ee}(s)\Theta^{\mu\nu}(p), \quad s = p^2$$

- Dressed Green's function

$$G_{\rho}^{\mu\nu}(p) = -\frac{\Theta^{\mu\nu}(p)}{p^2 - M^2 - p^2\Pi_{\rho\pi\pi}(p^2)} - \frac{\Lambda^{\mu\nu}(p)}{p^2 - M^2 + i0^+}$$

- dressed  $\gamma\pi\pi$  vertex to  $\mathcal{O}(e)$

$$i\Gamma_{\gamma\pi\pi}^{\mu} = \text{Diagram 3} + \text{Diagram 4} + \text{Diagram 5}$$

# VMD model (em. form factor of the $\pi$ )

- $\pi^+ + \pi^- \rightarrow e^+ + e^-$  (“time-like form factor”)

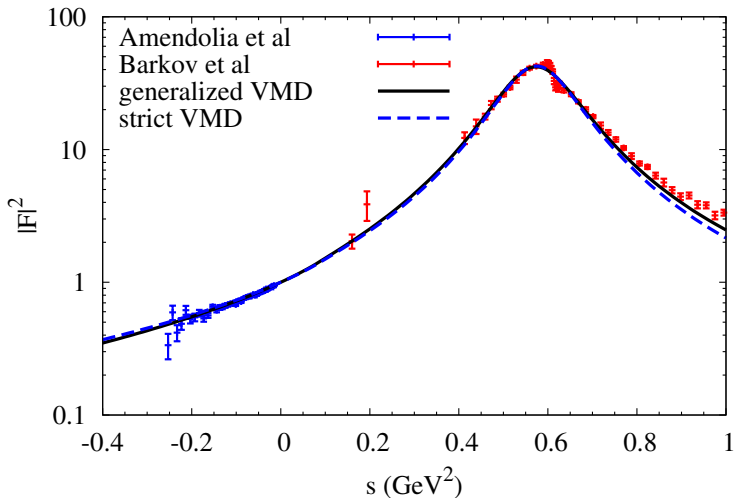

- $\Rightarrow |F(s)|^2$  with Mandelstam  $s = (p + q)^2$
- physical region  $s > 4m_\pi^2$
- $\pi^+ + e^- \rightarrow \pi^+ + e^-$  (“space-like form factor”)

- $\Rightarrow |F(t)|^2$  with Mandelstam  $t = (p - p')^2$
- physical region  $t < 0$

# VMD model: (fit of parameters)

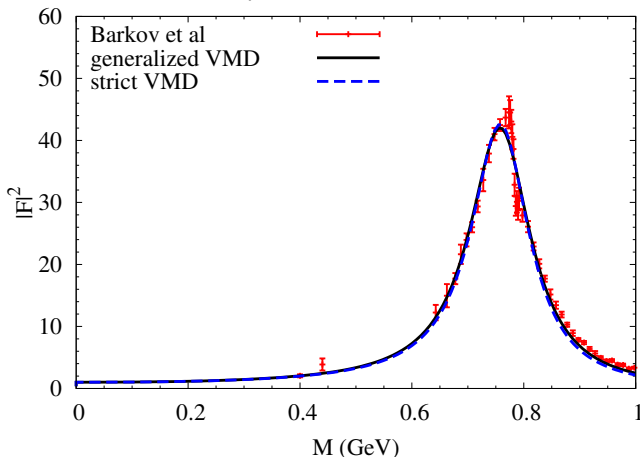

- best fit to form-factor data:  $g = 5.461$ ,  $g' = 5.233$ ,  $m_\rho = 763.1 \text{ MeV}/c^2$   
strict VMD:  $g \stackrel{!}{=} g' = 5.328$ ,  $m_\rho = 763.1 \text{ MeV}/c^2$

data from [\[A<sup>+</sup>86, BCE<sup>+</sup>85\]](#)

# VMD model: (fit of parameters)

- best fit to form-factor data:  $g = 5.461$ ,  $g' = 5.233$ ,  $m_\rho = 763.1 \text{ MeV}/c^2$   
strict VMD:  $g \stackrel{!}{=} g' = 5.328$ ,  $m_\rho = 763.1 \text{ MeV}/c^2$

data from [BCE<sup>+</sup>85]

- small discrepancies around  $\rho$  peak: **contribution from  $\omega(782)$  meson!**

# VMD (elastic $\pi\pi$ phase shift)

- $\pi\pi \rightarrow \pi\pi$  phase shift in  $I = 1$  channel

$$\delta_1^1 = \arccos \frac{\text{Re} G_\rho}{|G_\rho|}$$

data: [FP77]

# VMD: (total $\pi\pi$ elastic scattering cross section)

- $\pi\pi \rightarrow \pi\pi$  total cross section

- CERES data: pion- $\rho$  model too simplistic
- many approaches to more realistic models
  - gauged linear  $\sigma$ -model + vector-meson dominance [Pis95, UBW02]  
gauge-symmetry breaking  $\Rightarrow$  pions still in physical spectrum!
  - massive Yang-Mills model; gauged non-linear chiral model with explicitly broken gauge symmetry [Mei88, LSY95]
  - hidden local symmetry: Higgs-like chiral model [BK84, HY03, HY03]  
allows for vector manifestation or usual manifestation (with  $a_1$ )
- here we concentrate on the phenomenological model by Rapp, Wambach, et al [RW99]

# Hadronic many-body theory

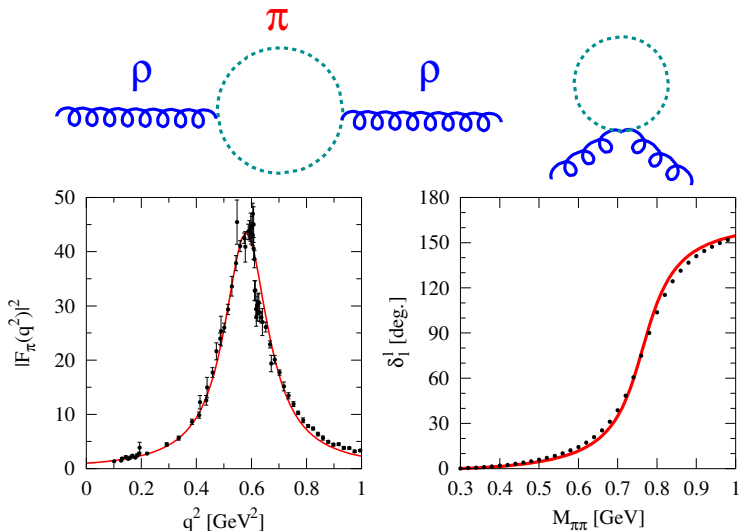

- Phenomenological HMBT [RW99] for vector mesons
- $\pi\pi$  interactions and **baryonic excitations**

- **Baryon (resonances)** important, even at RHIC with low **net** baryon density  
 $n_B - n_{\bar{B}}$
- reason:  $n_B + n_{\bar{B}}$  relevant (CP inv. of strong interactions)

# The meson sector (vacuum)

- most important for  $\rho$ -meson: pions

# The meson sector (matter)

- Pions dressed with  $N$ -hole-,  $\Delta$ -hole bubbles
- Ward-Takahashi  $\Rightarrow$  **vertex corrections** mandatory!

# The meson sector (contributions from higher resonances)

# The baryon sector (vacuum)

- $P = 1$ -baryons:  $p$ -wave coupling to  $\rho$ :  
 $N(939), \Delta(1232), N(1720), \Delta(1905)$
- $P = -1$ -baryons:  $s$ -wave coupling to  $\rho$ :  
 $N(1520), \Delta(1620), \Delta(1700)$

# Photoabsorption on nucleons and nuclei

# In-medium spectral functions and baryon effects

[R. Rapp, J. Wambach 99]

- **baryon effects** important
  - large contribution to broadening of the peak
  - responsible for most of the strength at small  $M$

# In-medium spectral functions and baryon effects

[R. Rapp, J. Wambach 99]

- **baryon effects** important
  - large contribution to broadening of the peak
  - responsible for most of the strength at small  $M$

# In-medium spectral functions and baryon effects

[R. Rapp, J. Wambach 99]

- **baryon effects** important
  - large contribution to broadening of the peak
  - responsible for most of the strength at small  $M$

# In-medium spectral functions and baryon effects

[R. Rapp, J. Wambach 99]

- **baryon effects** important
  - large contribution to broadening of the peak
  - responsible for most of the strength at small  $M$

# Dilepton rates: Hadron gas $\leftrightarrow$ QGP

- in-medium **hadron gas** matches with **QGP**
- similar results also for  $\gamma$  rates
- “quark-hadron duality”?
- **hidden local symm.+baryons?**

[BK84, HY03, Sas05, HS06]

# Quiz

- 1 in the QCD phase diagram some points labeled “Heavy-Ion Experiments” are shown. How are those points “measured” or determined?
- 2 what indicates that there is a collective fluid-like behavior of the hot and dense medium created in HICs?
- 3 how do we explain the elliptic flow,  $v_2$ , of hadrons in HICs?
- 4 why do we believe that the QGP is really created in HICs and why do we think it’s the most perfect fluid ever observed?
- 5 which important “theoretical quantity” can be measured by observing electromagnetic probes in HICs (and elementary reactions)?
- 6 what is chiral-symmetry restoration and in which ways could it be realized in nature?
- 7 what can we learn from QCD sum rules about  $\chi$ SR?
- 8 what tell effective hadronic models about the medium modification of light vector mesons and the related  $\chi$ SR?
- 9 what’s basic assumption of the vector-meson dominance (VMD) model?
- 10 why is the simple  $\pi\rho$  model insufficient to explain the dilepton data in HICs?
- 11 why are baryon-vector-meson interactions important even at high collision energies, where  $\mu_B \simeq 0$  (nearly 0 net-baryon density)?
