General Relativity Theory with the Computer An Interactive Lecture

DPG-Frühjahrstagung: Fachverband Gravitation und Relativitätstheorie Universität Bremen, 16. März 2017

Matthias Hanauske

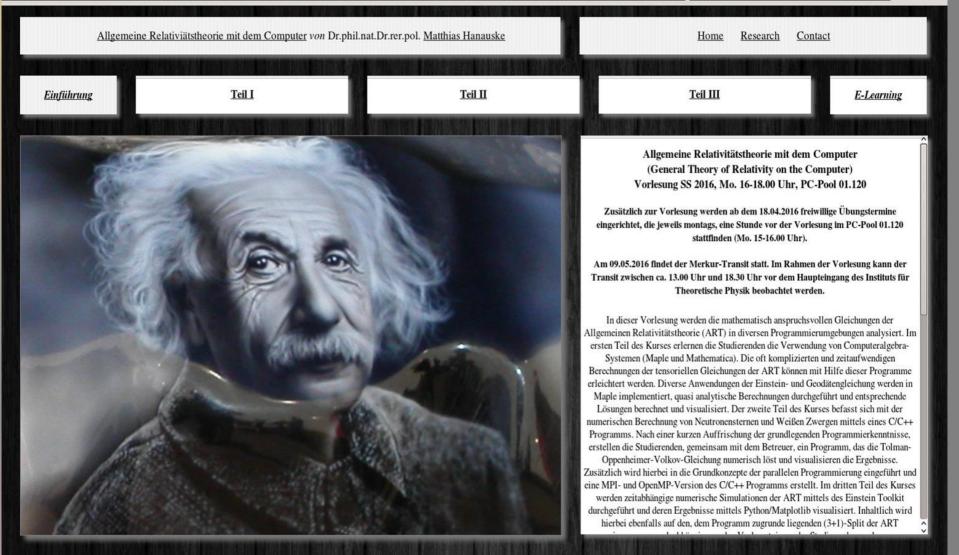

Frankfurt Institute for Advanced Studies Johann Wolfgang Goethe-University Institute for Theoretical Physics Department of Relativistic Astrophysics Frankfurt am Main, Germany

General Relativity Theory with the Computer

fias.uni-frankfurt.de/~hanauske/VARTC/

☆自♥

www.fias.uni-frankfurt/~hanauske/VARTC/

General Remarks

- ~25 Bachelor and Master Students
- Required previous knowledge:
 - Basic knowledge in general relativity (GR)
 - Basic knowledge in at least one programming language (e.g. c++, java, fortran, python, maple, mathematica, ...)
- Summersemester 2016 and 2017 at the University Frankfurt
- 3 creditpoints, individual oral examinations
- 2 hours per week in the Computer room at the Univ. Frankfurt
- Individualized exercises (E-Learning System Lon Capa)

Gravitational Wave Physics

Current Online Lecture (Peking-School)

Spring School on Numerical Relativity and

15th-25th May 2017, Beijing

www.fias.uni-frankfurt/~hanauske/VARTC/

Contents of the Lecture

• Teil I:

- Analytical solutions and numerical Simulations using Maple/Mathematica
- Scientific problems: calculating the Riemann- and Riccitensor, the Einstein equation and the geodesic equation for a given metric (e.g. Schwarzschild, Kerr), the non-rotating and rotating black hole, White Dwarf, Neutron and Quark stars and the Tollmann-Openheimer-Volkov (TOV) equation

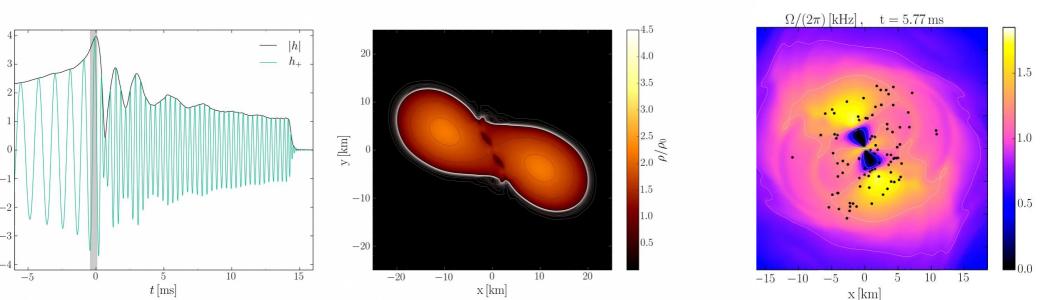

• Teil II

- Parallel programming using C++ and OpenMP/MPI
- Scientific problems: creating a parallel version of a C++ program that solves the interior and exterior solution of the metric and the internal propertie of a neutron star using different equation of states, theory of hybrid stars and twin stars

Contents of the Lecture

• Teil III:

- Computersimulation using the Einstein Toolkit
- Scientific problems: The (3+1)-split of general relativity, the ADM (and BSSNOK) equations, collapse of a neutron star to a black hole or a quark star, gravitational wave emission from a hybrid star binary system, how to observe the hadron-quark phase transition with future gravitational wave detectors, visualisation of simulation results using python and Mathplotlib

E-Learning

• E-learning platform: LON-CAPA (Learning Online Network with Computer-Assisted Personalized Approach)

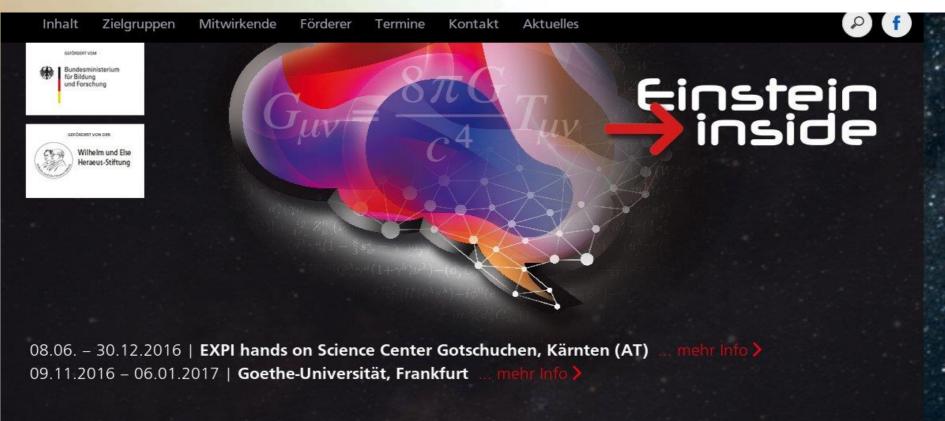

• Personalized exercises for the students to follow their individual understanding

• Online Tutor to help students

Summary and Outlook

- The lecture is for bachelor, master students and young researchers
- Basic knowledge in GR is required
- Everything is freely available: www.fias.uni-frankfurt/~hanauske/VARTC/
- Please contact me if you need a LON-CAPA account for the Online Course and the Peking-School (in english)
